

Claude web-design setup

Every tool from the reel, how to install each one in Claude Code, and a first site to try them on.

The setup

Piece	What it does	Install (Claude Code)	Link	License
Emil Kowalski skills	Design and motion skills from a design engineer, so Claude writes UI with real attention to animation and detail.	<code>npx skills@latest add emilkowalski/skills</code>	github.com/emilkowalski/skills · emilkowal.ski	MIT
Impeccable	A design skill plus commands to shape, critique and polish a frontend.	<code>npx impeccable install</code> then <code>/impeccable init</code> inside Claude Code	impeccable.style · github.com/pbakaus/impeccable	Apache-2.0
Taste skill	Pushes Claude away from generic “AI-looking” layouts toward stronger visual choices.	<code>npx skills add https://github.com/Leonxlnx/taste-skill</code>	tasteskill.dev · github.com/Leonxlnx/taste-skill	MIT
Figma MCP	Lets Claude read your Figma files (frames, tokens, components).	<code>claude plugin install figma@claude-plugins-official</code> (or manual: <code>claude mcp add --transport http figma https://mcp.figma.com/mcp</code>)	developers.figma.com/docs/figma-mcp-server	Figma service, needs a Figma account
Playwright MCP	Gives Claude a real browser so it can open the site it built and check it.	<code>claude mcp add playwright npx @playwright/mcp@latest</code>	github.com/microsoft/playwright-mcp	Apache-2.0

Want only one taste skill? The README lets you pick: `npx skills add https://github.com/Leonxlnx/taste-skill --skill "design-taste-frontend"`.

After installing, restart Claude Code and run `claude mcp list` to see Figma and Playwright connected.

Your first site in 4 steps

1. **Install the five pieces above** in a new, empty project folder, then open Claude Code there.

2. **Point it at a design (optional).** If you have a Figma frame, copy its link. No Figma? Skip it and just describe the look.
3. **Describe the site.** Paste the starter prompt below and fill in the brackets.
4. **Let it check its own work.** Ask Claude to open the page with Playwright, screenshot desktop and mobile, and fix what looks off. Repeat until you like it.

Starter prompt

```
Build a one-page website for [who you are / what you sell].  
Audience: [who it's for]. Goal: [the one action a visitor should take].  
Sections: hero, what I do, 3 examples of work, short FAQ, contact.  
Style: [3 words, e.g. calm, warm, editorial]. [Optional: match this Figma frame: <link>]  
  
Use the impeccable, taste and Emil Kowalski design skills. Keep motion subtle.  
Plain HTML/CSS/JS or Next.js, your call; explain the choice in one line.  
When done, open it with Playwright, screenshot at 1440px and 390px,  
list what looks wrong, fix it, and screenshot again.
```
